Programming and Data Structures with Python

File Input-Output

Interact with Buffer

"File handle"

1. Open file
Create file handle,
connects to file
2. Read/write to file handle
3. Close file

Open file

Open (filename, mode)

returns a file handle

↑
name of file

↑
read
write

Text files
Sequential
access
begin to end

```
fh = open("abc.txt", "r")  
      "w"
```

Read from file handle

content = fh.read() \rightarrow string with entire file

\Downarrow Line 1 -- \n Line \n -- \n
↳ part of input

x = input() — read one line

end of line "\n"
~~~~~ (\n) — not part of input  
Press ENTER

`fh.readline()`

Read one line (includes trailing "\n")

`fh.readlines()` → List of lines

```
fh = open("abc.txt", "r")
for l in fh.readlines():
    ≡
```

## Close file handle

`fh.close()`

"Disconnects file"

## Write

`fh = open("xyz", "w")`

Create or overwrite

`fh = open("xyz", "a")`

Append to end

`fh.write(s)`

Add "\n" yourself

fh.write\_lines()

Write a list of  
strings

```
infile = open("abc", "r")
```

```
outfile = open("xyz", "w")
```

```
for l in infile.read()
```

has in

```
outfile.write(l)
```

has in

```
infile.close()
```

```
outfile.close()
```

infile =

outfile =

contents = fh.readlines()

fh.writelines(contents)

Go to a specific  
position

fh.seek(-)

# Sequential

Textfile

Line 1 \n Line 2 \n Line 3 \n

→  
readline()

→  
readline()

→

→

End of file read ~ will return ""

# Numpy

Library to handle matrices

$$m = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}$$

$$[[0, 1], [1, 0]]$$

$$m[1][0] \quad m[1][1]$$

array

# Arrays in numpy

Python sequence  $\rightarrow$  create numpy array

$m[1][2] \rightsquigarrow m[1,2]$

"Broadcast"  $m * 3$  scalar multiplication
